

SGLT2 Inhibitors for People With Heart Failure

- ✔ SGLT2 inhibitors were initially created for people with diabetes, but we found that they have even greater benefits in patients with heart failure
- ✔ SGLT2 inhibitors are approved by the FDA for patients who do and do not have diabetes
- ✔ The heart failure guidelines recommend people with heart failure with low or normal pumping functions be prescribed an SGLT2 inhibitor

Examples of SGLT2 inhibitors for heart failure include:

Canagliflozin

Dapagliflozin

Empagliflozin

Sotagliflozin

HOW

HELP PEOPLE WITH HEART FAILURE:

They improve heart failure symptoms and help you feel better

They will help you to stay out of the hospital

They can prevent heart attacks

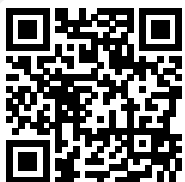

They will help you to live a longer, higher-quality life

Possible side effects of SGLT2 inhibitors:

- Urinary tract infection
- Genital yeast infection
- Increased urination
- Dehydration

Talk to your healthcare providers about:

1. Why you are taking an SGLT2 inhibitor
2. Any concerns that you have about the cost of the medicine
3. If you are sick and are not eating or drinking like usual
4. Any upcoming procedures or surgeries you have
